**Notes:**
- The seminar consists of 3 days, each with specific activities and exercises.
- The schedule is divided into segments of 90 minutes.
- The activities include exercises as a coach, insights from the coachee's perspective, and coaching practice.
- Open questions and evaluation reviews are also included.

**Key Points:**
- Instruction versus coaching is a focus of the seminar.
- Principles of the coaching method are discussed.
- Allocating the first exercises is addressed.
- Emergency braking is an example of coaching practice.
- Feedback discussions (pre and post) are integral.

**Additional Details:**
- Seating position, steering wheel, and mirror are highlighted in the seating arrangement.
- Classroom and in-car coaching exercises are specified.
- The seminar aims to transition from instruction to open questions.

**Objective:**
- To enhance coaching skills through practical exercises and theoretical insights.

**Expected Outcomes:**
- Participants will improve their coaching techniques.
- They will gain a deeper understanding of coaching principles.
- Practical application through exercises and feedback discussions.

**Conclusion:**
- The seminar is designed to provide a comprehensive approach to coaching, blending theory with practical application.
## Warming up

**Description of content**

The participants are split into 4 equally sized groups. Each group gets 10 minutes to address the question and prepare their answers.

Using the “Four corner method”, the following questions are asked:

- In your opinion, why do you think that young novice drivers are more likely than other drivers to have road accidents? Please try to describe your explanations in detail.

- When you were a novice driver, what did you do differently when driving compared to the way you drive today? Please try to describe your response in detail.

- What do you think that young people are concerned about during their time as novice drivers?

- How were your own experiences as a novice driver. What was not so easy for you?

Taking into account the results and experiences from each of the four corners, a discussion should ensue. The seminar leaders should guide the discussion with various questions and should focus on the specific social and learning context of young people when they are starting to drive solo.
Alternative questions with the same aim in mind could be:

- Why do experienced drivers crash?
- Why do novice drivers crash?
- What do you teach (i.e. to what extent does your teaching address why novice drivers crash)?

**Method description I “3 or 4 corner method”:**

4 flipcharts are placed around the seminar room, preferably in each corner. Each flipchart has its own question on it, amounting to 4 questions in total around the room.

The participants are split into 4 small groups. Each group is assigned to a flipchart and each group works simultaneously to answer the question written on it. Each group is given 7 minutes to answer the first question.

When the 7 minutes is over, the groups are asked to finish their work and proceed clockwise to the next flipchart.

The groups then begin working on their second question. But as one group has already worked on this question, and left their results on the flipchart, the second group will only have to add a few comments. So they will only need 5 minutes to do this.

When these 5 minutes are over, the groups are once again asked to proceed to the next flipchart in a clockwise direction. Each group then makes some additions to the results already left behind by the previous 2 groups. They are given 3 minutes to do this before proceeding in a clockwise direction, to make amendments to the last question for 3 more minutes.

![Diagram of the 3 or 4 corner method](image-url)
**The role of a coachee**

**Feedback from the participants on these participant-oriented methods**

**Procedure**

The participants should have a relaxed conversation in which they exchange their views on how they experienced the participant-oriented methods and what possible advantages and disadvantages these methods may have.

**Didactic aims**

The participants should be directly led into the role of coachee and, through questioning, be encouraged to give their views.

**Content aims**

The participants should identify, in their opinion, advantages and disadvantages of these methods.

---

<table>
<thead>
<tr>
<th>Coachee</th>
<th>Hermes-Coach</th>
</tr>
</thead>
</table>

In the following discussion round, specific questions could be useful. They serve purely as examples, and should not be interpreted as the only right answers to ask:

- How were your experiences working with questions on the flipcharts?
- What did you particularly enjoy, and why?
- What did you really not like at all?
- How did you feel when answering the questions?
- Did you find it easy or difficult to work in this way?
- What do you think about the results of the work?
- Do the results meet your expectations?
- Did you expect this kind of results?
- Now that you have these results, what could you do with them?
- In comparison to a presentation, what advantages do you see with this kind of exercise?
- What disadvantages could there be, in comparison to a presentation?

The opinions collected on the advantages and disadvantages of this kind of method should remain visible (for instance on cards on a pin board) for the following sessions.
Leading the communication by asking questions

The most important skill for a coach is to be able to ask the right questions at the right time. But attention: don’t put everything into a question! And especially in emergency situations instruct!

Don Palmer recommends starting an exercise with brainstorming about typical driving school instructions which then shall be converted into questions. The questions can be categorised in various types of questions.

Example: instructions such as “look in the mirror”, “leave more space” and “slow down” can be replaced by “what’s happening behind you?”, “how is your view when you hang back a bit?” and “how appropriate do you think you speed is?”

1. Write up the questions on the board
2. Ask the group what the effect of these questions is on the learner (instead of instructions?)
3. Ask the group to consider if these questions can be used as easily as instructions in in-car training?
4. Identify the challenges in using such questions and how the instructors can overcome them?

In a next step analyse each question with respect to the following classification of questions and if appropriate convert the questions (e.g. a closed into an open question; a judgmental into a non-judgmental question etc.)

- **Open versus closed questions:**
  (closed questions are to be answered with yes or no, either or, etc, open questions are those which begin with “why”, “how”, when”, “who” etc.)

  Example for closed: “Do you feel nervous?”
  Example for open: “How (nervous) do you feel?”

- **Non-jugement versus jugement questions:**
  Example judgmental: “Why did you drive so fast?”
  Example non-judgmental: “What factors did you take into account before deciding for this speed?”

- **Questions on sense and body-awareness versus intellectual questions:**
  Sensory questions can lead to greater awareness of comfort, stress, nerves and excitement.

  Example: “On a scale from 1-10, how stressed are you now?” “What could you do to reduce stress for let’s say one point only?”

- **Coaching questions versus questioning development:**
  In coaching questions the answer is up to the coachee. In questioning developing the learning contents is already clear right from the beginning but will be just elaborated by asking in order to activate the learner.

  Example for questioning development: “what does this traffic sign mean?”
  Example for a coaching question: “How stressed do you feel when you enter a roundabout?”

- **Questions on internal subject (referring to the two higher levels of the GDE-matrix, e.g. feelings, beliefs, self-evaluation etc.) versus questions on external facts**
(referring to the two lower levels of the GDE-matrix, e.g. traffic rules, driving techniques, hazard perception...):

Example for internal question: “What signs are there when you are getting tired?”
Example for external question: “What is written in the law about fatigue?”

The goals of this exercise is to become more aware of the impact of a question, to use questions rather than instruction and to have the competence to detect the best fitting question for the situation.

List of Coaching-questions:
The following questions are examples to be applied:

- What would you like to improve in your driving?
- What is the result you want to achieve?
- Once you have corrected the problem what would be the ultimate result?
- What is the problem?
- What are the possible ways to change?
- Which of these options would you choose?
- Where do the problems come from exactly?
- What would you have to change?
- What are you experiencing at this moment?
- What do you want to try next, what is best for you?
- What is important to you in driving?
- How do you decide what to do in this situation?
- How successful was that action?
- How confident do you feel now?
- What can you learn from this?
- Where would you apply this in real traffic?
- What will you focus on in this situation?
- What is the specific risk in this situation?
- How could you reduce the risk?
- What is the weakest aspect of your driving?
- How do you evaluate this?
- What do you want? What is best for you?
- Why is this so important for you?
- How will you decide?
- What do you think about this?
- How is this for you?
- What do you feel?
- What can we learn out of this?
- Where can we apply this in traffic?
- What for shall we especially take care of in this situation?
- What is the specific risk in this situation?
- How can we reduce the risk?
- Which accident would most likely happen to you?

If you lead the communication by asking goal guided questions the following steps are recommended for the learning-process for tasks located on the higher GDE-levels (It is what the coachee receives that counts, not what the coach tells):

1. Ask open question („W“)
2. Listen
3. Understand and summarize: e.g. “you mean that...”
4. Analyse pros and cons
5. The customer evaluates
6. If necessary, continue with open questions and if necessary add your opinion beside the customer's opinion
7. What does the customer you need and what would motivate him to apply this?

### Coaching situations – overview of scenarios

<table>
<thead>
<tr>
<th>Section</th>
<th>Contents</th>
<th>Procedure</th>
<th>Didactic aims</th>
<th>Content aims</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coaching situations</td>
<td>Overview of possible coaching scenarios</td>
<td>The participants are presented a range of scenarios and are asked to pick one out.</td>
<td>The participants shall realise that coaching cannot be learned through a presentation or lecture. Therefore one aim of the seminar should be that each participant carries out at least one practical exercise in the role of the coach.</td>
<td>The participants should become aware of a range of possible coaching scenarios in driver training. The participants should think of other possible scenarios.</td>
</tr>
</tbody>
</table>

The scenarios that are presented in this session and that will be later developed into practical coaching scenarios, are all taken from the first few hours of in-car training and are therefore appropriate for trying out coaching for the first time. The following themes are included in these scenarios:

- Seating position
- Holding the steering wheel
- Adjusting mirrors

The plan is for two groups to carry out these scenarios simultaneously on day 2 of the seminar using the method “aquarium”. This should enable, already at this early stage, for 6 participants to assume the role of coach.

The six participants assuming the role of coach will be asked to prepare their coaching task for the next day and to carry out the coaching scenario on day 2 of the seminar.
Tasks to prepare a coaching exercise!

Which Scenario do you want to prepare?

__________________________________________________________________________

Step 1: What do you think, which content is important?

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

Step 2: Formulate questions which can help you to discuss the contents.

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

Step 3: Change the questions into open questions which can support your coachee.

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________

__________________________________________________________________________
Exercise for the end of day 1

To give the participants an impression of coaching it can be useful to make a exercise with the GROW-Model.

G  Goal  What do you want?
R  Reality  What is happening now?
O  Options  What could you do?
W  Will (Wrap up)  What will you do?

Ask your participants to write down a short answer when you were asking one of the following questions. Please use only one question for G, one for R, one for O and one for W.

Possible questions to formulate goals:

- What do you want to change in your driver education?
- What would be the outcome for you?
- How would your driving change?
- How would you change yourself?

Possible questions to get answers about the reality:

- Which problems could occur if you change something?
- Whom concern this?
- What do you have done for it that it works?
- What can restrain you?

Possible questions to get answers about the options?

- Which possibilities do you have to start?
- What can you do more or different?

Possible questions to get answers about the will:

- Which possibilities do you prefer?
- At which time do you want to do something?
- Who must be involved?
- What help do you need?

At the end of this exercise it is possible to close it with the following question:

What was the decision for the wording?

The goal is to make clear that only the coachee can say what he wants.
Remark:

In the German speaking countries often they use the SMART-method instead of the GROW-model.

S   specific (spezifisch)
M   measurable (messbar)
A   attractive (attraktiv, aktionsorientiert)
R   realistic (realistisch)
T   terminable (terminierbar)

End Day 1
Beginning Day 2

After a short welcome, there will be a quick summary of day 1 of the course in the form of feedback from participants on what they experienced.

Then the first exercises should be carried out based on the descriptions below. These exercises can and should where possible take place in a car. If this is not possible, a second room needs to be made available. You need a very quiet surrounding, that all observers can listen to what the coaches and coachees are taking about.

</table>
Method description II “Aquarium“:

The Aquarium method involves splitting the participants into 3 categories:

- One participant who assumes the role of coach
- Several participants who play the role of coachee (learner drivers)
- Several participants who are given the role of ‘observers’

The ‘Aquarium’ concept means that a particular action is being observed from the outside and that these observers can then give their feedback on what happened in a neutral way.
Evaluation session:

The evaluation is carried out in the following order:

- First, the coach tells the group how he experienced the exercise and if he is happy or unhappy about the result.
- Then the coachees tell the group how they experienced the exercise and what they felt while they were role playing.
- Finally, the observers report to the group what they recognised.

The results are presented by writing keywords on cards and posting them up on a board. These results are then used to start developing principles for coaching.
At the end of this part it is possible to pick up the information about which contents they have talked in this exercise.

Then, 4 different participants are asked to prepare the following scenarios, using coaching methods:

- Before the training really begins. First contact – in the classroom (see Scenario Nr. S1)
- Before the training really begins. First contact – in the car (see Scenario Nr. S2)
- Preparing the feedback drive (see Scenario S3)
- De-briefing after the feedback drive (see Scenario S4)
Exercise: Before the training begins in theory lesson

<th>Procedure</th>
<th>Didactic aims</th>
<th>Content aims</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coaching exercise</td>
<td><strong>Scenario S1</strong> Before the training really begins – first contact in driver training (theory lesson)</td>
<td>Two participants should work on this exercise. The exercise should be carried out based on Description S1, where one participant assumes responsibility for &quot;Collecting the reasons&quot; and ensuring they are properly categorised. The other participant is in charge of the sequences 'identifying risks' and 'strategies for minimising risks'. The exercise will be carried out using the Aquarium method. Once both participants have completed their task, a group evaluation takes place according to the order and procedure below.</td>
<td>The participants should experience how different methods can be combined to achieve a comprehensive result. Coaching methods should either be practised or observed. The evaluation session should also serve to further develop the principles of coaching that have already been identified.</td>
<td>The participants should focus on the upper levels of the GDE matrix and learn how the matrix can be covered in practice.</td>
</tr>
</tbody>
</table>

45 Minutes
Evaluation session

The evaluation is carried out in the following order:

- First, the person in the role of the coach tells the group how he experienced the exercise and if he is happy or unhappy about the result.
- Then the coachees tell the group how they experienced the exercise and how they felt.
- Finally, the observers report to the group what they recognised.

The results are presented by writing keywords on cards and posting them up on a board. These results should help to further develop the principles of coaching.

The following questions could facilitate this process:

- Can you see any additional aspects that you would like to add to the coaching principles?
- Did you have any other experiences that you would like to see reflected in the coaching principles?

**Impressions from the coaching exercise**

**Principles for Coaching**
Scenario S1: First contact in classroom

Before the training really starts – first contact in driver training

Background:

Driving a car is not a rational movement from A to B. It is a complex activity in a social context. In this way, car trips and their associated risks are strongly determined by the driver’s motives and reasons for driving and by their attitudes in life and attitudes towards road traffic. Very few drivers are aware of this. The earlier drivers address these factors and really get to grips with them, the greater their ability will be to assess driving situations in a self-critical way, to reduce risk and/or avoid specific situations altogether.

Focus within GDE matrix

Levels 3 and 4

Primary aim:

Learner drivers should become more aware of their reasons for wanting to drive, and of their attitudes towards driving. They should identify the risks linked to these factors and what they can do firstly to recognise risky situations and secondly how to reduce the associated risk or avoid the situations altogether.

Secondary aims:

- The learner drivers should list 3 important reasons for wanting to obtain a driving licence.
- The learner drivers should reflect on – and identify - whether or not the reason (either a motive for driving or an attitude) could lead to increased risk when driving.
- The learner drivers should reflect – and identify – if there are risk-increasing factors linked to the individual reasons which would make driving riskier.
- The learner drivers should become aware how to recognise when they are in a risky situation.
- The learner drivers should think about what they can do to minimise the risk or to avoid the risky situation altogether.

Method:

Individual work (visualisation of individual contributions on the board) / guided group discussion / work in small groups

Procedure:

Ask the learner drivers to think about the following aspect. The following question may be useful to get things started:

- What are the 3 most important reasons for you wanting to get a driving licence?

Give the learner drivers 5 minutes to prepare their answers. Then give each learner 3 pin board cards and ask them to write each reason on a separate card.
In the meantime, the seminar leader prepares two pin boards with the following titles on them: Reasons / motives for driving und Attitudes/goals for life

After 5 minutes are over ask each learner driver to present each of their cards and to allocate them to one of the two boards (categorisation). They should also clarify what is written on the cards if it is not easily understood.

The following question could help in this process: Can you imagine what is meant by this?

When all the cards have been posted on the boards, the seminar leader asks the whole group if they agree with the categorisation or if there are questions. Then place obvious duplications (cards with the same reasons on it) on top of each other or in a way that it is obvious that there are several cards stating the same thing.

Then ask the learner drivers to consider if there are any risks associated with the reasons on the board, or if there are any risk-increasing factors which could lead to unsafe driving.

The following questions may help:

- Amongst this range of reasons for wanting a licence, are there any reasons here which could make driving riskier?
- Could you imagine that any of the reasons could lead to risky driving?
- Are there any situations linked to these reasons which could involve risk-increasing factors?

Write down, again on pin board cards any risk-increasing factors which arise from the discussion and sort them under a new heading on the pin board “risk-increasing factors”.

![Diagram of pin boards with categories and risk-increasing factors]
Now work on the third step “Options/Strategies” which aims to work out ways to recognise risky situations and to reduce the risks or to avoid the risky situation altogether (Self-reflection).

Split the participants into 2 to 4 groups and give two or three reasons for wanting a licence to each group, with the associated risks. Give each group 10 minutes to think about how to recognise the risky situations and to find ways to minimise or remove the risks.

The following questions may help in this process:

- How do you think you could recognise if you are in a driving situation with increased risk? What could you do to tackle this risk?
- Why do you think a car trip can become risky and what could you do in such situations?
- What makes you think that such a reason can lead to risky car driving and what would you do in such circumstances?

Ask the learner drivers to write their results on green pin board cards. Inform the participants that they will have to present their results later to the whole group and will have to allocate their results to the pin board in the following way:

<table>

Evaluation session

The evaluation is carried out in the following order:

- First, the coach tells the group how he experienced this exercise and if he is happy or unhappy about the result.
- Then the coachees tell the group how they experienced the exercise and how they felt.
- Finally, the observers report to the group what they saw.

The results are presented by writing keywords on cards and posting them up on a board. These results should further develop the principles of coaching.

At the end of this evaluation session there should be a further evaluation carried out by the HERMES Coach (seminar leader) with the coachees in this particular exercise, in order to survey their impressions.

The results of this discussion could also be added to the already elaborated principles of coaching.
Scenario S2: First contact in car

Before the training really begins – first contact in driver training

Background:

Driving a car is not a rational movement from A to B. It is a complex activity in a social context. In this way, car trips and their associated risks are strongly determined by the drivers’ motives and reasons for driving and by their attitudes in life and attitudes towards road traffic. Very few drivers are sufficiently aware of this fact. The earlier drivers address these factors and really get to grips with them, the greater their ability will be to assess driving situations in a self-critical way, to reduce risk and/or avoid specific situations altogether.

Some countries only have practical driver training so there are no theory lessons or group sessions. In these cases, the instructor can only use the time in the car to address these themes.

Focus within GDE matrix

Levels 3 and 4

Primary aim:

Learner drivers should become more aware of their reasons for wanting to drive and of their attitudes towards driving. They should identify the risks linked to these factors and what they can do firstly to recognise risky situations and secondly how to reduce the associated risk or avoid the situations altogether.

Secondary aims:

- The learner driver should list important reasons for wanting to obtain a driving licence.
- The learner driver should reflect on – and identify - whether or not his reasons (either a motive for driving or an attitude) could lead to increased risk when driving.
- The learner driver should reflect – and identify – if there are risk-increasing factors linked to the individual reasons which would make driving riskier.
- The learner driver should become aware how to recognise when he/she is in a risky situation.
- The learner driver should think about what he/she can do to minimise the risk or to avoid the risky situation altogether.

Method:

Partner work / Dialogue
Procedure:

Coachee and coach address the subject in a dialogue. The coach leads with questions and tries to focus on important aspects with further questioning. At the end of the conversation, the coachee should be given some homework, namely to observe friends and parents (for example) in between driving lessons, with regard to what has been discussed.

The following questions could be used to start up the conversation:

- Could you briefly describe to me why you want to get a driving licence?
- Why do you actually want a driving licence?
- What expectations do you have regarding a driving licence?
- What hopes and wishes are linked to the driving licence?
- When you think about a driving licence, what thoughts spring to mind?
- How do you imagine yourself, when you have your driving licence?

To continue the conversation further, the following questions could help you focus in on risk-increasing factors:

- What expectations do you have from me in this process?
- In your opinion, what could lead to this car trips becoming risky?
- Are there driving situations where you would assume there will be more risk than usual?
- Is there perhaps something which could happen during these trips which could lead you to drive in a riskier way?
- Can you think of any similar trips with your friends where you have felt uncomfortable, and why?
- Have you ever been a passenger in a car where you have felt uncomfortable? Why did you feel that way?

To focus on in the self-evaluation aspect, the following questions could be useful:

- Can you imagine how you would recognise that this trip is riskier than others?
- Have you already been on car trips where you already felt in advance that you wouldn’t feel right? Why was that?
- What options do you have in advance of the trip to make the trip less risky?
- In your opinion, what could you bear in mind to avoid getting into such a risky situation?
Following the conversation, a self-observation and self-reflection sheet could be written up.

Remark:

If the participants still have troubles in understanding Coaching, the HERMES coaches may demonstrate this sequence. The participants will then be able to get a good impression of a goal-guided coaching process.

<td></td>
</tr>
</tbody>
</table>

Coachee | Coach | Observer | Hermes-Coach
Following the exercise an evaluation is carried out in each small group.

At the beginning the coach is asked to describe his experiences. The following questions could facilitate the process:

- What did your experiences when carrying out this exercise?
- What, based on your experiences, do you think worked well and why?
- What, based on your experiences, do you think did not work that well and why?
- Which experiences are particularly important for you for your future work?

Then the coachees reveal how they experienced the exercise. The following questions could facilitate the process.

- What did you feel when carrying out the exercise?
- What did you particularly enjoy?
- What did you not like so much?
- What else would you have wanted?

Finally, the observer is asked to tell about his observations. The following questions could facilitate the process:

- What, based on your experiences, do you think went particularly well and why?
- What, based on your experiences, do you think did not work that well and why?
- What, based on your observations, would you have done differently and why?

At this stage it could be useful to further amend the principles of coaching with any important new findings.

**Scenario Nr. S5 (car/track) Emergency braking**

**Background:**

Especially at the beginning of their driving career young novice drivers often experience suddenly developing situations (e.g. suddenly a car is in front of them, a car crosses, pedestrians, a car pulls out of its parking spot) which force them to carry out unusual braking manoeuvres (braking and avoiding, emergency braking).

Often these emergency braking manoeuvres are not carried out strongly enough, resulting in unnecessarily long braking distances. Young novice drivers assume that these situations are quite common, especially in dense city traffic.

These situations reveal two deficits which originate at different levels:

a) Lack of experience in recognising driving situations which require immediate action
b) Emergency braking is not carried out correctly

The focus of this exercise is to develop in a group the necessary “tools” (understanding and handling) for emergency braking to ensure a fast and efficient reaction.

**Focus within the GDE-Matrix:**

Level 1
Aims:

- The learner driver should list different situations from his / her experience where emergency braking can be necessary.
- The learner driver should describe what has to be done in order to carry out emergency braking in the most effective way.
- The learner driver should carry out emergency braking and should describe his / her experiences.
- The learner driver repeats the emergency braking until an optimum result is reached.
- The learner driver should realise how important the right seating position is.

Procedure:

At the beginning the learner driver is asked if he has already experienced situations where an emergency braking manoeuvre was necessary.

The following questions could be used to start up the conversation and further introduce the topic:

- What do you need to do to carry out an emergency braking in the most effective way?
- What could you observe when the driver carried out a particularly effective emergency braking?
- What do you think is most important for carrying out effective emergency braking?

Then, emergency braking is carried out. For evaluation of the emergency braking manoeuvres, the following questions could be useful:

- What did you feel when carrying out the emergency braking?
- What was comfortable, what was not so comfortable and why?
- What could you do to avoid the uncomfortable feeling in future?
- What could you do in order to shorten the braking distance even further?

This training and feedback should be repeated until a reasonable short braking distance is achieved.

<td>Coaching as a method</td>
<td>Basic principles of coaching.</td>
<td>The whole group further develops the principles of coaching based on the exercises in the afternoon of the second day. For this purpose the results from the morning of Day 2 are used.</td>
<td>The participants should experience how already existing work results can be used and further amended.</td>
<td>The participants should integrate their experiences from additional exercises into the existing checklist of coaching principles, amend and correct it.</td>
</tr>
</tbody>
</table>

**45 Minutes**

**Principles for Coaching**

Taking into account new experiences, the existing chart should be amended. The following questions could facilitate this process:

- How were your experiences with the exercises yesterday?
- What would be really important for you in order to apply coaching methods effectively in the future?
- What would you definitely want to avoid if you wanted to use coaching in your future work?
- What would you absolutely want to add to the existing principles of coaching?
- Based on your experience, what principles would not be that important anymore?

The work and discussion results are added to the existing flipchart and grouped or removed and questioned. It is important to ask why something should be added or removed.

90 minutes

Coachee  
Coach  
Observer  
Coach II  
Hermes-Coach
**Scenario S6: Distraction on track**

**Passengers in the car – Distraction through the group**

**Background:**

Young novice drivers often transport several passengers of the same age group to spend their free time together. These driving situations can generate a lot of typical risks for this age group – group pressure, group dynamics, distraction, experiencing free time, showing off, prodding somebody, noise level and so on.

These situations can hardly be experienced during driver training. The learner drivers can only refer to their experiences as passengers in a car at this point of time. Experiences as drivers in such situations are rare. Presentations or discussions on this topic are often experienced as ‘lecturing’ and simply telling young people how risky their behaviour is.

Therefore it is important to create a situation where young learner drivers are distracted by their passengers and experience the consequences of this distraction in a safe environment, followed by a discussion and evaluation of their experiences.

**Focus within GDE-Matrix:**

Level 3 and 4

**Aims:**

- The learner drivers should experience how passengers can influence their driving by provoking an emergency braking;
- The learner drivers should realise how difficult but also how important it is for the driver not to get distracted by passengers;
- The learner drivers should experience an (almost) surprise emergency braking situation;
- The learner drivers should reflect on what it means to take along passengers and the responsibility involved;
- The learner drivers should realise how important it is to avoid situations where emergency braking could become necessary if they are taking passengers along with them in their car.

**Method:**

Practical exercise on a closed area in small groups

**Procedure:**

The exercises are only carried out towards the end of the driver training, or even after completion, once a certain level of experience in terms of vehicle manoeuvring has been achieved. Own (solo) driving experience is desirable.

When carrying out the exercise it is important to stress that each participant receives his / her own written assignment which is only intended for them and which is secret. Exchanging the different assignments before the exercise is carried out undermines the desired effect.
Attention needs to be paid to the correct wearing of the seatbelt of all persons in the car (driver and passengers). The driver in each group has to reach a constant speed of 40 km/h before any action is taken. The track has to be at minimum of 105 m long and 10 m wide.

No more than 12 participants (3 groups) should be coached on the training area at the same time by the coach / driving instructor. It is important that only one car is on the activity area at any time and has left the safety zone before the next car starts. Each group only drives once which means that not every participant will play the role of driver. The number of drivers is therefore limited to 3.
Group of 4 people in one car “What happened?”

One driver and three passengers each receive a written, top secret assignment. All four are asked to get into the car and drive to the starting point.

**Attention, top secret!!!**
**Assignment driver**

Please drive at a speed of constantly 40 km/h. As soon as you hear the word “sun shade” carry out an emergency braking!

**Attention, top secret!!!**
**Assignment passenger I**

“As soon as your driver has reached a constant speed of 40 km/h read out, loud and clear, the following words. Once you reached the last word start from the beginning again:

„Sunscreen, Midsummer, sunburn, sun allergy, summer sun, sunbathe, sun shade“.

**Attention, top secret!!!**
**Assignment passenger I**

„As soon as your driver has reached a constant speed of 40 km/h read out, loud and clear, the following words. Once you reached the last word start from the beginning again:

„Winter sports, winter cold, winter sun, winter months, winter joy, winter service, winter mood, winter tan“.

**Attention, top secret!!!**
**Assignment passenger I**

„As soon as your driver has reached a constant speed of 40 km/h read out, loud and clear, the following words. Once you reached the last word start from the beginning again:

„Rain worm, rain shower, rain puddles, rain clouds, rain period, rainy mood“

Expected Results:

a) The driver does not carry out an emergency braking manoeuvre even though the word “sun shade” is mentioned, as he / she does not realise it because of the distraction due to all passengers talking at the same time. Therefore it is important to inform the driver at the beginning of the exercise that he has to stop before leaving the safety zone.

b) The driver already stops as soon as he / she hears any word containing the word “sun” in it.

Both scenarios are good and important for the evaluation.
Evaluation:

This exercise results in experiences which will be retained a long time by the driver as well as the passengers, so the exercise absolutely must be evaluated. Starting with the reading out of the assignments of the driver as well as the passenger they will talk about their experiences using the following questions. First the drivers should tell their experiences, then the passengers.

- What happened and what did you feel as the driver?
- How did you feel as a passenger? How did you feel during the braking?

First collect all experiences and then further develop the discussion. The following questions may help:

- How does this experience affect your braking in daily traffic situations?
- How does this experience affect carrying passengers in daily traffic situations?
- What could you do in order to avoid abrupt braking?
- What possibilities do you have to avoid such situations?

The results can be noted on a flipchart.
Scenario S11: Passengers in the car - on track

Background:

Young, novice drivers often encounter situations where they drive with peer-age passengers in social, free-time situations. These situations involve a number of specific risk factors for youngsters, such as group pressure, group dynamics, distraction, free-time spirit, showing off, goading, high-volume, etc.

Driver training barely offers the opportunity to address these driving situations, so the learners can only rely on what they have previously experienced as passengers. It is unlikely that they can experience, before solo driving, such situations from a driver’s perspective. Young people often feel they are being treated like children if they are lectured about particular risks ("You are a very high-risk group") so much of the effects of such lectures is lost.

In this regard it is important to create situations in which learners drive with passengers in situations where they are distracted. These situations can take place in a safe (off-road) environment and can then be discussed and evaluated.

Level of GDE matrix reached:

Levels 3 and 4

Aims:

- The learner or novice drivers should experience how their driving ability can be disturbed as a result of distraction;
- The learner or novice drivers should recognize how difficult but how important it is not to be distracted by passengers;
- The learner or novice drivers should experience, as passengers, a surprising situation;
- The learner drivers should consider what these experiences mean for normal driving in traffic.

Method:

Practical exercise in closed-off area in pairs

Procedure:

This exercise should be either carried out at the end of initial driver training or after initial training, once their basic vehicle control skills are well developed. It can be useful if the drivers already have some initial solo driving experience.

To carry out these exercises effectively, it is essential for each individual passenger to receive a written task which the passenger must keep for himself. Any prior exchange on the tasks to be carried out will destroy the expected effect of the exercises.

All drivers and passengers should be wearing seatbelts at all times.
No more than 12 participants (6 pairs) should be on the training area at the same time. Only one vehicle should be on the action surface at any given time. Only when the previous car has left the surface should the next car begin.

Step 1: **Driving through a slalom without distraction**

Each participant is asked to drive smoothly through a slalom. It may be useful for some participants to drive a second time around, so that they can improve their fluidity.

Step 2: **Driving through a slalom with distractions**

Following step 1, the participants are asked if they would like to experience the slalom as a passenger. Half of the group is then chosen as passengers. The drivers are asked to go to their cars and the passengers stay behind.

The passengers are then given a task to distract the driver. The drivers should not see the exchange take place.
Note: secret task

Do not tell anyone else

You are just about to experience a slalom as a passenger. Your task is to confuse your driver about half way through the course. The driver should not know in advance what you are going to do.

Once your driver has started to smoothly drive around the slalom, and about half way through, ask the following question in a louder-than-usual voice:

“Hey, can I turn on the radio?”

Observe his reaction and tell the others about it in the evaluation session afterwards.

Note: secret task

Do not tell anyone else

You are just about to experience a slalom as a passenger. Your task is to confuse your driver about half way through the course. The driver should not know in advance what you are going to do.

Once your driver has started to smoothly drive around the slalom, and about half way through, ask the following question in a louder-than-usual voice:

„What time is it actually?“

Observe his reaction and tell the others about it in the evaluation session afterwards.
Note: secret task

You are just about to experience a slalom as a passenger. Your task is to confuse your driver about half way through the course. The driver should not know in advance what you are going to do.

Once your driver has started to smoothly drive around the slalom, and about half way through, ask the following question in a louder-than-usual voice:

“What is the square root of 129?”

Observe his reaction and tell the others about it in the evaluation session afterwards.

Note: secret task
Do not tell anyone else

You are just about to experience a slalom as a passenger. Your task is to confuse your driver about half way through the course. The driver should not know in advance what you are going to do.

Once your driver has started to smoothly drive around the slalom, and about half way through, ask the following question in a louder-than-usual voice:

„Nice shoes – where did you buy them?“

Observe his reaction and tell the others about it in the evaluation session afterwards.
Note: secret task

Do not tell anyone else

You are just about to experience a slalom as a passenger. Your task is to confuse your driver about half way through the course. The driver should not know in advance what you are going to do.

Once your driver has started to smoothly drive around the slalom, and about half way through, ask the following question in a louder-than-usual voice:

“Damned, that’s what it was!”

Observe his reaction and tell the others about it in the evaluation session afterwards.

Note: secret task

Do not tell anyone else

You are just about to experience a slalom as a passenger. Your task is to confuse your driver about half way through the course. The driver should not know in advance what you are going to do.

Once your driver has started to smoothly drive around the slalom, and about half way through, ask the following question in a louder-than-usual voice:

“Cool - did you see that?”

Observe his reaction and tell the others about it in the evaluation session afterwards.
Evaluation:

An evaluation session should take place after the 6 drives have completed their exercises (only half of the group will experience the distraction from the perspective of the driver):

First ask the driver what happened and how he experienced it.

Then ask the passenger what he has observed at the moment he tried to distract the driver.

The following questions can be used to follow up on these observations:

- What do your experiences today have to do with your normal daily driving?
- Have you already experienced a similar situation when you or another driver was distracted because of a question or comment from someone else in the car? What exactly happened?
- What could you do to try to avoid such distractions?
Scenario S7: Passengers in the car – in classroom

Background:

Young novice drivers often take along several passengers of the same age group to spend their spare time together. These driving situations generate a lot of typical risks for this age group – group pressure, group dynamics, distraction, experiencing free time, showing off, prodding somebody, noise level and so on.

These situations can hardly be experienced during driver training. The learner drivers can only refer to their experiences as passengers in a car at this point of time. Experiences as drivers in such situations are rare. Presentations or discussions on this topic are often experienced as ‘lecturing’ and telling young people how risky their behaviour is.

It is necessary to change perspective altogether, in order to enable peer-to-peer learning. This is only possible when the person him/herself has recently had similar experiences. Young people have plenty of good and bad experiences as passengers in a car. They should use these experiences as car passengers to draw conclusions with regard to their role as driver.

Focus within GDE-Matrix:

Level 3 and 4

Aims:

- The learner drivers should answer certain questions referring to their experiences as passengers.
- The learner drivers should state, based on their experiences, how the driver is acting when they feel especially comfortable.
- The learner driver should state, based on their experiences, how the driver is acting when they feel uncomfortable.
- The learner drivers should, based on their experiences, describe the types of behaviour of passengers which could lead to riskier driving situations.
- The learner drivers should, based on their experiences, describe potential measures to prevent passengers having a negative influence on the driver.
- The learner drivers should discuss the difficulties involved in implementing these strategies and any further support which could facilitate their use and application.

Method:

4-corner-method

Procedure:

The participants are split into 4 small groups. 4 flipcharts are placed around the room, one in each corner. Each flipchart has its own question on it.

Question 1: How is your driver driving if you do not feel comfortable as a passenger?

Questions 2: How is your driver driving if you feel especially comfortable as a passenger?
Question 3: What could you do that may encourage your driver to take more risks?

Question 4: How should your driver react if your behaviour is encouraging him to drive riskier than usual?

1. How is your driver driving if you do not feel comfortable as a passenger?
2. How is your driver driving if you feel especially comfortable as a passenger?
3. What could you do that may encourage your driver to take more risks?
4. How should your driver react if your behaviour is encouraging him to drive riskier than usual?

Each group is assigned to a corner and should note down answers to the question on the flipchart. Each group is given 7 minutes.

Next, each group proceeds clockwise to the next flipchart and the next question. They should only amend the work of the previous group on the flipchart and are therefore given 5 minutes to carry out this task.

When these 5 minutes are over, the four groups proceed once again to the next flipchart and the next question. They are given 3 minutes for further amendments before changing the last time in a clockwise direction for a further 3 minutes of amendments to the last question.
After all 4 groups have answered all four questions the participants are thanked for their contributions.

Following this part the different questions are replaced by the headings below:

Heading 1: This is what I am going to avoid ensuring my passengers always feel comfortable.

Heading 2: This is how I am going to drive to ensure my passengers feel comfortable.

Heading 3: I will especially pay attention to this specific behaviour of my passengers.

Heading 4: This is what I am going to do if the behaviour of my passengers is influencing my driving in a negative way.

Evaluation:

The results of this exercise are strategies developed by the young novice drivers based on their experiences. However, a group discussion led by a coach is necessary to treat the topic in even more detail and to allow the young novice drivers to work intensively with the strategies they have developed and their implementation. The following questions could facilitate the process:

- What could happen that you drive in a riskier way and for your passengers feel uncomfortable? How could this be avoided?

- What could make it difficult to detect risky behaviour from passengers? What could help you to do so?

- Considering your experiences, do you think that passengers will be easy to handle with the strategies which have been developed together? Could difficult situations occur and if so what else could you do in this case?
Scenario S8: Passengers in the car – classroom in addition

Possibly in addition, depending on the time available

Scenario S6 and S7 both deal with the passenger problem.

In scenario S7 this topic is treated in the classroom based on the existing experiences of the participants.

In scenario S6 the main focus is on the exercise and the resulting practical experiences and impressions.

The German 2nd – phase – model “further education for novice drivers” uses similar methods. In this case, the results of both scenarios are combined in a final session with the aim of developing useful strategies for the future.

Scenario S7  Scenario S6

This is what I shall avoid, in order to ensure my passengers feel comfortable.

This is how I am going to drive to ensure my passengers feel comfortable.

I will especially pay attention to this specific behaviour of my passengers.

This is what I am going to do if the behaviour of my passengers is influencing my driving in a negative way.

This is how I can avoid abrupt braking!

This is how I can avoid similar situations with passengers!

During the discussion the participants should talk about what can easily be applied in practice and where they see difficulties. The reasons for these statements are especially important in order to further develop future strategies.

### Alternative:

Instead of Scenario S9 it is also possible to use Scenario S12 “Driving around bends”. With this scenario you have a similar situation in a car in the normal traffic and it is possible to train asking open questions during driving in traffic. As an added goal you were talking about driving around bends.
Scenario S9: Distance-keeping in the car

Background:

Young novice drivers often get into situations where their safety margins are insufficient and thus they need to brake very sharply.

These drivers have learned about the correct safety margin in driving school but they do often not apply it in practice. The reason for this is related to personal experience (based on feelings rather than rational factors) and to observing the safety margins of other road users. Distance-keeping is one of those areas where decisions are made based on a feeling rather than a rational analysis.

In addition, there are a lot of factors which encourage driving too closely to other traffic. These factors include stress, time pressure, irritation, desire, fun, a carefree attitude and many others. These are factors that relate more to the higher levels of the GDE matrix. This scenario provides opportunities and support to develop and apply decision-making and monitoring of safety margins.

Focus within GDE-Matrix:

Levels 2 (3 and 4)

Aims:

- The learner should think about the necessary safety margin
- The learner should reflect on and name what could support him to maintain the right safety margin
- The learner should see if such support really helps him/her in practical traffic situations.
- The learner should try to keep sufficient safety margins in a variety of situations.

Method:

Discussion / dialogue / Training / Evaluation

Procedure:

First try to engage in a relaxed conversation with the learner about choosing the right safety margins when driving. The following questions may be useful:

- The law states that drivers should respect a certain distance between you and the car in front. Why should we, as drivers, maintain a certain distance in front?
- What springs to mind when talking about the concept of safety margins?
- What would you say if I was to ask you how you choose the right safety margin?
- What do you think about when considering the safety margin between your car and the car in front?

Then continue asking questions in order to provide support to the learner driver. The following questions could be used:
• How could you know when the safety margin is sufficient?
• What could help you to determine a sufficient safety margin?
• What could you help you to find a safe distance?
• How could you test to see if you have really chosen a safe margin?

Then ask the learner to drive and to choose a safety margin which he/she feels comfortable with. Using the following question, get the learner to justify his choice of safety margin:

Why do you feel comfortable?

After this question you need to decide in which direction you will be asking further questions because it could turn out that the learner is comfortable with an insufficient safety margin to the car in front. The following questions could help you here:

• At what point would you begin to feel uncomfortable?
• How can you test to see if your safety margin is safe?
• How can you regularly check your safety margins?
• How can you check that you always maintain a distance you feel comfortable with?

Get your learner to choose his safety margins in a variety of situations. Then ask more frequently how the learner feels on a scale of 1 to 10 and get him to train as long as he is motivated.
Scenario S10: Distance-keeping on a practice ground

**Background:**

This scenario is already successfully carried out by a number of course providers in certain EU-countries.

Young novice drivers often get into situations where their safety margins are insufficient and thus they need to brake very sharply.

These drivers have learned about the correct safety margin in driving school but they do often not apply it in practice. The reason for this is related to personal experience (based on feelings rather than rational factors) and to observing the safety margins of other road users. Distance-keeping is one of those areas where decisions are made based on a feeling rather than a rational analysis.

In addition, there are a lot of factors which encourage driving too closely to other traffic. These factors include stress, time pressure, irritation, desire, fun, a carefree attitude and many others. These are factors that relate more to the higher levels of the GDE matrix. This scenario provides opportunities and support to develop and apply decision-making and monitoring of safety margins.

**Focus within GDE-Matrix:**

Levels 2 (3 and 4)

**Aims:**

- The learners should think about the necessary safety margin
- The learners should reflect on and name what could support him to maintain the right safety margin
- The learners should experience the results of insufficient safety margins
- The learners should think about and name what could help them to maintain safe margins in the future.

**Method:**

Practical exercise with evaluation discussion

**Procedure:**

First try to engage in a relaxed conversation with the learners about choosing the right safety margins when driving. The following questions may be useful:

- The law states that drivers should respect a certain distance between you and the car in front. Why should we, as drivers, maintain a certain distance in front?
- What springs to mind when talking about the concept of safety margins?
- What would you say if I was to ask you how you choose the right safety margin?
- What do you think about when considering the safety margin between your car and the car in front?
Then ask for a volunteer in the group to take part in a distance-keeping exercise.

You, as coach, will drive ahead in a car. One participant (with passengers if possible) is asked to follow in his car, maintaining a distance that he feels comfortable with. The cars should be staggered so the participant’s car is not directly behind the coach’s car (see sketch). Ask the participant in the rear car to drive at the same speed (around 50km/h) as your car. When you brake (only once you have passed the spectators) the volunteer in the rear car should brake too so as to come to a standstill behind you. Leave the vehicles in the exact position they come to a stop.

The other participants make up the observation group. They should stand in a safe area to the side of the track and carry out the following tasks:

- One participant: Please observe precisely how much time elapses between the coach’s car braking lights coming on and the volunteer braking.
- One participant: Please observe precisely how sharply the volunteer brakes.

Next, the coach should carry out an evaluation with the group based on the template below.
The following procedure is recommended:

First, ask the driver (volunteer) what happened. The following questions may be useful:

- What do you feel at the moment?
- What did you think when you saw the brake light of my car coming on?
- What were you thinking when you were braking?
- How did the braking go, in your opinion?
- What do you think when you see where your car finally stopped?
- For whom do you keep the safety margin?

You can then ask the same questions to the passengers, in order to bring out the emotional impact of the experience.

Then ask the observers what they saw based on the tasks they were given.

Then ask questions to try to work out ways to support the drivers with maintaining and checking their safety margins. The following questions could be used:

- How could you know when the safety margin is sufficient?
- What could help you to determine a sufficient safety margin?
- What could you help you to find a safe distance?
- How could you test to see if you have really chosen a safe margin?

You could also repeat this exercise with all participants, until they have set themselves sufficient safety margins. In this way, the participants can find out for themselves what safety margin is necessary.

**Scenario S12: Driving around bends with the car**

**With orientation points**

**Background:**

Young novice drivers learn how to drive around bends during initial training but they often do not develop a clear procedure to do this (speed, scanning). Driving instructors tend to correct here, rather than support the learner. This sometimes leads to youngsters driving too quickly on their first solo trips, without orientation points. Orientation support given by the instructor may not work because each of us perceives different things and we may not see things the same way as the instructor.

**Level of GDE matrix reached:**

Level 2

**Aims:**

- The learner driver should work out for himself what orientation points could help him to safely navigate bends.
• The learner driver should actively practise driving around bends, using the orientation points he has previously chosen, and then assess the overall experience.
• The learner driver may then improve his choice of orientation points.
• The learner driver works out and explains why his chosen orientation points help him drive around bends.
• The learner driver should make a point of driving around several bends, using his orientation points, and give a driving commentary in at least one of them.

Procedure:

At the beginning of the session, inform the learner that the goal of this lesson is to get him to independently and safely drive around bends using orientation points.

Consider leading the discussion by using the following questions:

Imagine you want to drive around a bend on a rural road.

• What external features (curb, tree row, guide post, road marking etc.) could you help to orientate in order to stay in your lane?
• What do you need to know about the bend to be able to drive around it safely?
• What else do you need to know about the curve to be able to drive around it safely?
• What is important to observe when driving around a bend?

Then let the learner drive around 2 or 3 bends, using the navigational points he has previously mentioned. Then jointly assess the experience by asking questions such as:

• What did you recognise when driving around these bends?
• Did everything go as planned, or was anything different?
• Did you use the orientation points that you thought up before, or did you use others?
• Based on this experience, what do you think is important for driving safely around bends?
• What is really important before driving around a bend?
• Did you have to change anything else to feel more comfortable when driving around the bends?

Then ask the learner to explain why his chosen orientation points allow him to drive safely around bends. Then allow the learner to drive around a couple of more bends and ask him to give a driving commentary during one of them (What is he looking at? What can he see?).

When the learner has had enough practical experience driving around bends, you can evaluate the whole thing by using questions such as:

• What did you feel this time when driving around these bends?
• What differences were there compared to the previous ones?
• Is it easy or difficult for you to orientate yourself around bends?
• Did your chosen orientation points make you feel safe or did you choose other points?
• Do you think you have reached the goal of today’s session?
The participants should exchange their experiences and answers to still open questions should be found.

The participants should practice coaching a lot. To take fear away it will be helpful to practice coaching in other areas of life, for example with kids or in sports or with colleagues. The following questions may be helpful:

- What do you want to do first if you want to practice coaching?
- Who can give you feedback?
- In which situation is it possible for you to practice coaching?
